Signal Validation — does the fraud flag mean anything?

Before building any detection view, I tested whether the fraud flag relates to any field in the dataset.
It doesn't.

By city: flag rates run 3.58% to 3.60% against a 3.59% baseline — a spread of two hundredths of a point across nine cities.

By channel: the same, with no channel standing out.

By risk score: flagged and unflagged transactions score identically. Velocity averages 10.50 against 10.51. Geo-anomaly is 0.50 for both. Spending deviation is identical.

Those averages are the tell. 10.5 is the mean of a uniform distribution across the velocity range, and 0.50 the mean of a uniform 0–1 scale — the values were drawn at random, and the flag was applied independently of them.

Conclusion: the fraud flag was assigned at random. No high-risk channel, no risky region, no peak period exists in this data, and no detection model could be trained on it. This page documents that finding rather than reporting patterns the data cannot support.

Flag rate by city

location	Fraud Rate %
Berlin	3.59%
Dubai	3.58%
London	3.60%
New York	3.59%
Singapore	3.59%
Sydney	3.59%
Tokyo	3.58%
Toronto	3.60%
Total	3.59%

Flag rate by payment channel

payment_channel	Fraud Rate %
ACH	3.58%
card	3.59%
UPI	3.59%
wire_transfer	3.60%
Total	3.59%
